

# Laser Nail Fungus Treatment Consent

Lasers can treat most nail fungus by penetrating the nail and destroying the fungus embedded in and under the nail plate. In clinical studies there have been no adverse reactions, injuries or disabilities. I understand that clinical results may vary in different patients; however studies indicate that 68---90% of treated patients show significant nail improvement with laser treatments.

I understand that although rare, there may be complications with laser therapy, which may include but not limited to: pigmentation changes, redness, swelling, tenderness and/or temporary worsening of the appearance of my nail(s).

I understand that the fungus may not be completely destroyed, that the nail may become reinfected or there may be other types of infection present. The nail may continue to be discolored or not attach to the nail bed. This treatment will not change the shape, width or other deformity of the nail plate. It may be necessary to perform additional treatments to obtain optimal results. With all of this in mind, I am choosing to try Edan's Med Spa Pulsed Nd:YAG 1064 noninvasive laser treatment for nail fungus.

I understand photographs will be taken before and possibly after my procedure. I further agree that these photos will be used for medical documentation in my personal records and will not be published unless Edan's Med Spa receives my written consent to do so.

I certify that I am at least 18 years of age, have read or have had read to me, the contents of this form. I understand the risks and alternatives to this procedure. I agree to all the terms of this agreement.
